

The tool used was Uizard.io, which, after asking "I need a nice and friendly page, with yucatecan stuff and spiders for my crochet knitting business" ended up throwing spiders and nonsense threads, obviously without any yucatecan stuff. The AI manages to fulfill only the part of the layout of elements for a specific function such as showing the details of a product, displaying a home page where I can put in large one of my most recent products and in small several best sellers, the shopping cart and the order. However, in terms of colors and attractiveness it has nothing at all since the page doesn't even know what something yucatecan is.

It is very interesting to note how an AI just did moderately well in 30 seconds what I would do badly in at least 1 hour and a half in an exam, it is too easy to use that tool to be able to get the code afterwards. In terms of colors and view of the page is very poor, assuming that after exporting the page I will make modifications, how do I know that It is still useful?

As for the usability attributes I would have to do tests to be able to measure them, the layout of the elements on the page seems somewhat generic as any page to sell products like MINIMO or WalMart so I do not doubt that at least it is easy to learn and use.

Given what i have seen now, it is possible that the role of UX will change, but for the better, that is, AI is still not able to do 100% of the job of UX since it goes beyond creating a user interface, it is about understanding the needs of a human so that it has to investigate the way of thinking of its customer. That is why, rather than harming, AI can actually be a very time-saving tool, as it can easily generate a lot of things if you know how to ask it.

In short, AI is a powerful tool but still incapable of understanding the human mind and needs, in the same way that a computer with respect to data analysts, AI can help to make things more efficient and save a lot of things, of course taking into account that just like agile methodologies in project development, if you do not know how to use it, it is very likely that it will only end up making it more expensive.
