UI Design Patterns

As such, we have not applied the Navigation Drawer, I would say that it is one of the most used design patterns to display relevant information to the user or in a more digestible way, there are many apps that use this Navigation Drawer, such as the application of Va y Ven, Bancomer, among others. As such this pattern has not been applied but from my perspective I would say that it would be very useful if we want to represent the information so that it is more pleasant for the user without being overwhelmed and not having to search through a maze of options. Now, it would be relevant because we have to take into account that most users are looking for new applications to be as similar as possible to other applications they have used before, a well-known example would be Facebook, which we already know that by the bell icon, we know that we have a notification; this design of the bell could also be added to our app so that it generates a sense of familiarity with the user and to make their interaction more enjoyable.
